

## Approach to the Patient with Acid-Base Problems

---

---

---

---

---

---

---

---

## Maintenance of Normal pH

◆ normal pH = 7.40 -->  $[H^+] = 40 \text{ neq / L}$

◆  $H_2O + CO_2 \leftrightarrow H_2CO_3 \leftrightarrow H^+ + HCO_3^-$

---

---

---

---

---

---

---

---

## Henderson - Hasselbach Equation

◆  $H_2O + CO_2 \leftrightarrow H_2CO_3 \leftrightarrow H^+ + HCO_3^-$   
is equivalent to:

◆  $pH = 6.1 + \log \{ [HCO_3^-] / [H_2CO_3] \}$   
is equivalent to:

◆  $pH = 6.1 + \log \{ [HCO_3^-] / (.03 \times pCO_2) \}$

which can be approximated by the formula

---

---

---

---

---

---

---

---

$$[H^+] = 24 \times pCO_2 / [HCO_3^-]$$

- ◆ Normally,  $[H^+]$  = 40 neq / L
- ◆ Normally,  $pCO_2$  = 40 mm Hg
- ◆ Normally,  $[HCO_3^-]$  = 24 meq / L

◆ Remember this formula !!!!!

---

---

---

---

---

---

---

---

$$[H^+] = 24 \times pCO_2 / [HCO_3^-]$$

- ◆ This formula is easy to remember

---

---

---

---

---

---

---

---

$$[H^+] = 24 \times pCO_2 / [HCO_3^-]$$

- ◆ This formula is easy to remember
- ◆ The constant is easy to remember (same as the usual  $[HCO_3^-]$  level)

---

---

---

---

---

---

---

---

$$[H^+] = 24 \times pCO_2 / [HCO_3^-]$$

- ◆ This formula is easy to remember
- ◆ The constant is easy to remember (same as the usual [HCO<sub>3</sub>] level)
- ◆ And...most importantly →

---

---

---

---

---

---

---

---

$$[H^+] = 24 \times pCO_2 / [HCO_3^-]$$

This formula shows that it is the RATIO of CO<sub>2</sub> and HCO<sub>3</sub> which determines pH

$$\frac{pCO_2}{[HCO_3^-]}$$

---

---

---

---

---

---

---

---

$$[H^+] = 24 \times pCO_2 / [HCO_3^-]$$

- ◆ Getting from [H<sup>+</sup>] to pH (or back)
- ◆ Converting from [H<sup>+</sup>] to pH can be easy if you are a savant, if you carry a calculator, or if you take advantage of the fact that, over the range of physiologic pH, the relationship between [H<sup>+</sup>] and pH is almost linear

---

---

---

---

---

---

---

---

$$[H^+] = 24 \times pCO_2 / [HCO_3^-]$$

- ◆ This formula is usable because, in the range of pH values we usually deal with, there is a nearly linear relationship between pH and  $[H^+]$

<u>pH</u>	<u>actual <math>[H^+]</math></u>	<u>estimated <math>[H^+]</math></u>
7.10	79	70
7.20	63	60
7.30	50	50
7.50	32	30

---

---

---

---

---

---

---

---

### Regulation of pH – 3 mechanisms

---

---

---

---

---

---

---

---

### Regulation of pH – 3 mechanisms

- ◆ Buffering

---

---

---

---

---

---

---

---

## Regulation of pH – 3 mechanisms

- ◆ Buffering
- ◆ Respiratory regulation of  $p\text{CO}_2$

---

---

---

---

---

---

---

---

## Regulation of pH – 3 mechanisms

- ◆ Buffering
- ◆ Respiratory regulation of  $p\text{CO}_2$
- ◆ Renal regulation of  $[\text{H}^+]$  and  $[\text{HCO}_3^-]$

---

---

---

---

---

---

---

---

## Regulation of pH – 3 mechanisms

Different Mechanisms

Different Speeds

---

---

---

---

---

---

---

---

## Regulation of pH -- mechanisms

- ◆ Buffering -- OCCURS IMMEDIATELY
  - No semipermeable membranes to cross
  - No enzyme activation necessary
  - Everything needed is right at hand

---

---

---

---

---

---

---

---

## Regulation of pH -- mechanisms

- ◆ Buffering -- OCCURS IMMEDIATELY
- ◆ Respiratory changes OCCUR OVER HOURS
  - Brainstem response to pH
  - Delay in CSF pH changes

---

---

---

---

---

---

---

---

## Regulation of pH -- mechanisms

- ◆ Buffering -- OCCURS IMMEDIATELY
- ◆ Respiratory changes are INTERMEDIATE
- ◆ Renal changes OCCUR MORE SLOWLY
  - Physiologic changes in renal H<sup>+</sup> excretion

---

---

---

---

---

---

---

---

## Buffering

- ◆ Extracellular
  - almost entirely through bicarbonate
    - » it's concentration is highest
  - small contribution from phosphate
- ◆  $\text{H}_2\text{O} + \text{CO}_2 \leftrightarrow \text{H}_2\text{CO}_3 \leftrightarrow \text{H}^+ + \text{HCO}_3^-$
- ◆ Intracellular

---

---

---

---

---

---

---

---

## Buffering

- ◆ Extracellular
- ◆ Intracellular
  - hemoglobin can directly buffer protons
    - »  $\text{H}^+$  entry into RBC matched by exit of  $\text{Na}^+$  and  $\text{K}^+$
    - » relationship between pH and measured  $[\text{K}^+]$
  - hemoglobin can directly buffer dissolved  $\text{CO}_2$
  - intracellular conversion of  $\text{CO}_2$  (and  $\text{H}_2\text{O}$ ) to  $\text{H}^+$  and  $\text{HCO}_3^-$  → generation of  $\text{HCO}_3^-$ 
    - »  $\text{H}^+$  buffered by Hb;  $\text{HCO}_3^-$  exchanges for  $\text{Cl}^-$

---

---

---

---

---

---

---

---

## Respiratory regulation of $\text{pCO}_2$

- ◆  $\text{pCO}_2$  is inversely proportional to VENTILATION
- ◆ Ventilation increases in response to a drop in pH, and falls when pH rises
  - respiratory center in medulla
  - responds to pH “intermediate” between that of CSF and plasma
  - response is rapid (though not instantaneous)
  - response is more predictable for falls in pH than for increases

---

---

---

---

---

---

---

---

Renal Regulation of  $[H^+]$  and  $[HCO_3^-]$

A DUMB KIDNEY WILL  
USUALLY DO BETTER  
THAN A SMART DOCTOR

---

---

---

---

---

---

---

---

Renal Regulation of  $[H^+]$  and  $[HCO_3^-]$

TWO MAJOR FUNCTIONS OF THE  
KIDNEY (regarding acid-base reg.)

---

---

---

---

## Renal Regulation of $[H^+]$ and $[HCO_3^-]$

Factors which effect renal acid excretion (bicarbonate reclamation)

ACID EXCRETION IS INHIBITED BY:

- ◆ Alkalemia
- ◆ Elevated  $[HCO_3^-]$
- ◆ Hypocapnea
- ◆ ? Hyperkalemia

---

---

---

---

---

---

---

---

## Renal Regulation of $[H^+]$ and $[HCO_3^-]$

Remember:

Compared to BUFFERING and RESPIRATORY adaptation, RENAL compensatory mechanisms take a bit longer.

---

---

---

---

---

---

---

---

## Definitions

---

- ◆ Acidemia = pH below the normal of ~ 7.40
- ◆ Alkalemia = pH above the normal of ~ 7.40

---

---

---

---

---

---

---

---

## Definitions

---

- ◆ Acidemia = pH below the normal of ~ 7.40
- ◆ Alkalemia = pH above the normal of ~ 7.40
  
- ◆ Metabolic acidosis = loss of  $[\text{HCO}_3^-]$  or addition of  $[\text{H}^+]$
- ◆ Metabolic alkalosis = loss of  $[\text{H}^+]$  or addition of  $[\text{HCO}_3^-]$

---

---

---

---

---

---

---

---

## Definitions

---

- ◆ Acidemia = pH below the normal of ~ 7.40
- ◆ Alkalemia = pH above the normal of ~ 7.40
  
- ◆ Metabolic acidosis = loss of  $[\text{HCO}_3^-]$  or addition of  $[\text{H}^+]$
- ◆ Metabolic alkalosis = loss of  $[\text{H}^+]$  or addition of  $[\text{HCO}_3^-]$
  
- ◆ Respiratory acidosis = increase in  $\text{pCO}_2$
- ◆ Respiratory alkalosis = decrease in  $\text{pCO}_2$

---

---

---

---

---

---

---

---

## The ANION GAP

- ◆  $\text{Na}^+ - \text{Cl}^- - \text{HCO}_3^- = 8-12$  normally
  - mainly proteins, phosphates, and sulfates

---

---

---

---

---

---

---

---

## The ANION GAP

- ◆  $\text{Na}^+ - \text{Cl}^- - \text{HCO}_3^- = 8-12$  normally
  - mainly proteins, phosphates, and sulfates
- ◆ In any patient with an acid-base disturbance, and especially in those with a metabolic acidosis, you should calculate the Anion Gap

---

---

---

---

---

---

---

---

## The ANION GAP

- ◆  $\text{Na}^+ - \text{Cl}^- - \text{HCO}_3^- = 8-12$  normally
  - mainly proteins, phosphates, and sulfates
- ◆ In any patient with an acid-base disturbance, and especially in those with a metabolic acidosis, you should calculate the Anion Gap
- ◆ BRAINSTEM REFLEX

---

---

---

---

---

---

---

---

## High Anion Gap Metabolic Acidosis

---

USUALLY FROM ADDITION OF ACID

---

---

---

---

---

---

---

---

## High Anion Gap Metabolic Acidosis

---

USUALLY FROM ADDITION OF ACID

- ◆ Ketoacidosis
  - DKA, Alcoholic KA, Starvation

---

---

---

---

---

---

---

---

## High Anion Gap Metabolic Acidosis

---

USUALLY FROM ADDITION OF ACID

- ◆ Ketoacidosis
  - DKA, Alcoholic KA, Starvation
- ◆ Lactic acidosis
  - hypoperfusion; other causes

---

---

---

---

---

---

---

---

## High Anion Gap Metabolic Acidosis

---

USUALLY FROM ADDITION OF ACID

- ◆ **Ketoacidosis**
  - DKA, Alcoholic KA, Starvation
- ◆ **Lactic acidosis**
  - hypoperfusion; other causes
- ◆ **Ingestions**
  - ASA, Ethylene glycol, methanol
- ◆ **Renal insufficiency**
  - inability to excrete acid

---

---

---

---

---

---

---

---

## Normal Anion Gap Metabolic Acidosis

---

- ◆ Rise in Chloride matches the decrease in  $\text{HCO}_3^-$

---

---

---

---

---

---

---

---

## Normal Anion Gap Metabolic Acidosis

---

- ◆ **Renal Disease**
  - proximal or distal RTA
  - renal insufficiency ( $\text{HCO}_3^-$  loss)
  - hypoaldosteronism /  $\text{K}^+$  sparing diuretics

---

---

---

---

---

---

---

---

## Normal Anion Gap Metabolic Acidosis

---

### ◆ Renal Disease

- proximal or distal RTA
- renal insufficiency ( $\text{HCO}_3^-$  loss)
- hypoaldosteronism /  $\text{K}^+$  sparing diuretics

### ◆ Loss of alkali

- diarrhea
- ureterosigmoidostomy

---

---

---

---

---

---

---

---

## Normal Anion Gap Metabolic Acidosis

---

### ◆ Renal Disease

- proximal or distal RTA
- renal insufficiency ( $\text{HCO}_3^-$  loss)
- hypoaldosteronism /  $\text{K}^+$  sparing diuretics

### ◆ Loss of alkali

- diarrhea
- ureterosigmoidostomy

### ◆ Ingestions

- carbonic anhydrase inhibitors

---

---

---

---

---

---

---

---

## Compensation

---

A “simple” acid-base disturbance is one with a primary problem (respiratory or metabolic, acidosis or alkalosis) leading to a compensation in the other arm.

---

---

---

---

---

---

---

---

## Compensation

---

A “simple” acid-base disturbance is one with a primary problem (respiratory or metabolic, acidosis or alkalosis) leading to a compensation in the other arm.

Primary metabolic problem – respiratory compensation

---

---

---

---

---

---

---

---

## Compensation

---

A “simple” acid-base disturbance is one with a primary problem (respiratory or metabolic, acidosis or alkalosis) leading to a compensation in the other arm.

Primary metabolic problem – respiratory compensation

Primary respiratory problem – metabolic compensation

---

---

---

---

---

---

---

---

## Compensation

---

THREE THINGS TO REMEMBER

---

---

---

---

---

---

---

---

## Compensation

---

### THREE THINGS TO REMEMBER

- 1) Compensation is not immediate

---

---

---

---

---

---

---

---

## Compensation

---

### THREE THINGS TO REMEMBER

- 1) Compensation is not immediate
- 2) Compensation is not complete

---

---

---

---

---

---

---

---

## Compensation

---

### THREE THINGS TO REMEMBER

- 1) Compensation is not immediate
- 2) Compensation is not complete
- 3) The  $p\text{CO}_2$  and  $\text{HCO}_3$  move in the same direction

---

---

---

---

---

---

---

---

## Compensation - Rules

These formulas are **EMPIRICALLY DERIVED** from observation and measurement.

---

---

---

---

---

---

---

---

## Compensation - Rules

### Respiratory Compensation for Metabolic Changes

- ◆ Metabolic acidosis
  - $p\text{CO}_2$  decreases by 1.2 x the drop in  $[\text{HCO}_3^-]$  ↖ important !!
- ◆ Metabolic alkalosis
  - $p\text{CO}_2$  increases by .7 x the rise in  $[\text{HCO}_3^-]$
  - less predictable than the comp. for acidosis

COMPENSATION IS USUALLY NOT COMPLETE

---

---

---

---

---

---

---

---

## Compensation - Rules

### Metabolic Compensation for Respiratory Changes

- ◆ Respiratory Acidosis
  - ACUTE:  $[\text{HCO}_3^-]$  increases by .1 x the rise in  $p\text{CO}_2$
  - CHRONIC:  $[\text{HCO}_3^-]$  increases by .35 x the rise in  $p\text{CO}_2$
- ◆ Respiratory Alkalosis
  - ACUTE:  $[\text{HCO}_3^-]$  decreases by .2 x the fall in  $p\text{CO}_2$
  - CHRONIC :  $[\text{HCO}_3^-]$  decreases by .5 x the fall in  $p\text{CO}_2$

COMPENSATION IS USUALLY NOT COMPLETE

---

---

---

---

---

---

---

---

## Approach to the Patient

### ◆ History and Physical Examination

- In the majority of cases you should be able to predict, qualitatively, the type of disturbance

### ◆ Examples:

- a patient with septic shock (hypoperfusion)
- a patient with severe COPD
- a patient with one day of worsening asthma

---

---

---

---

---

---

---

---

## Approach to the Patient

- ◆ Is the patient **ACIDEMIC** or **ALKALEMIC** ?
- ◆ What is the  $[\text{HCO}_3^-]$  ?
  - elevated ---- metabolic alkalosis
  - decreased -- metabolic acidosis
- ◆ What is the Anion Gap
- ◆ What is the  $\text{pCO}_2$  ?
  - elevated --- respiratory acidosis
  - decreased -- respiratory alkalosis
- ◆ Is the degree of compensation what you expect?

---

---

---

---

---

---

---

---

## Notation for Laboratory Values

Na+	Cl-	BUN	Glu
K+	HCO <sub>3</sub> <sup>-</sup>	Cr.	

pH / pCO<sub>2</sub> / pO<sub>2</sub> / base excess ON FIO<sub>2</sub>

---

---

---

---

---

---

---

---

## Case 1 - History and Physical

The patient is a 73 year-old man admitted with profuse diarrhea. Stool culture later grows *Salmonella*. On admission his blood pressure is 100/60 mm Hg when lying. Upon sitting it drops to 70/40 mm Hg. Skin turgor is reduced.

WHAT ABNORMALITIES WOULD YOU EXPECT BASED ON THIS INFORMATION??

---

---

---

---

---

---

---

---

## *Salmonella* diarrhea -- Lab values

133	118	}
2.5	5	

ABG on Room Air  
7.11 / 16 / 96

[H<sup>+</sup>] = 77 neq / L

---

---

---

---

---

---

---

---

## Case 1) *Salmonella* diarrhea -- Answers

133	118	7.11 / 16 / 96
2.5	5	[H <sup>+</sup> ] = 77 neq / L

The patient is profoundly acidemic. The very low bicarbonate clearly indicates that the acidosis is, at least in part, metabolic. The anion gap is NORMAL, pointing us in the direction of a limited number of possible causes. The expected decrement in CO<sub>2</sub> is --> 1.2 x (25-5) = 1.2 X 20 = 24, and this is actually what we see in this case. The potassium is low because of loss in the diarrheal fluid.

---

---

---

---

---

---

---

---

## Case 2 -- History and Physical

A 26 year-old man with IDDM stopped taking his insulin because he was depressed. His family brought him to the emergency room the next day in a semi-comatose state.

On physical examination he was obtunded. His HR was 130, RR 24 and deep, BP 110/60 mm Hg.

WHAT ABNORMALITIES WOULD YOU PREDICT ???

---

---

---

---

---

---

---

---

## IDDM without Insulin -- Predictions

- ◆ Lack of insulin --> KETOGENESIS and Hyperglycemia
- ◆ Obligate urination (osmotic diuresis) --> dehydration --> hypoperfusion --> inadequate oxygen delivery --> LACTIC ACIDOSIS
- ◆ Effect on K<sup>+</sup>
  - net loss of K b/o urination
  - possible high plasma K<sup>+</sup> -- for what reason??

---

---

---

---

---

---

---

---

## Diabetic -- Lab Values

140	105	51	470
4.8	6	2.3	

ABG on RA: 7.10 / 20 / 92  
urine dipstick: large ketones

---

---

---

---

---

---

---

---

## Case 2) DKA -- Interpretation

140	105	51	470	ABG on RA: 7.10 / 20 / 92
4.8	6	2.3		

The patient is profoundly acidemic. The very low HCO<sub>3</sub><sup>-</sup> is c/w a metabolic acidosis.

The anion gap is 19 -- above normal. From our list, the two most obvious candidates for are DKA and LACTIC ACIDOSOS.

The measured K<sup>+</sup> is normal, though we strongly suspect that total body K<sup>+</sup> is low.

The respiratory response is a little bit less than predicted, perhaps b/o fatigue.

---

---

---

---

---

---

---

---

## Case 3 -- History and Physical

A young woman with a seizure disorder suffers a grand-mal seizure in the waiting room of the Emergency Department. She has been waiting to have a laceration evaluated.

She is promptly brought to the treatment area.

WHAT ABNORMALITIES WOULD YOU EXPECT TO SEE BASED ON THIS INFORMATION ???

---

---

---

---

---

---

---

---

## Seizure Disorder -- Predictions

- ◆ She might have difficulty with ventilation during her seizure, leading to hypercapnea and a respiratory acidosis.
- ◆ The intense muscle activity might exceed her anaerobic threshold, leading to a lactic acidosis.

---

---

---

---

---

---

---

---

## Seizure Victim -- Lab Values

140	98	}
4.0	17	

ABG on RA: 7.14 / 45 / 86

---

---

---

---

---

---

---

---

## Case 3) Seizure Victim -- Interpretation

140	98	}	ABG on RA: 7.14 / 45 / 86
4.0	17		

The patient has a profound acidemia.

The cause of this problem is a COMBINATION of a high-anion-gap METABOLIC ACIDOSIS (AG = 25), and a moderate RESPIRATORY ACIDOSIS.

---

---

---

---

---

---

---

---

## Case 4 -- History and Physical

- ◆ A 52 y/o man with longstanding COPD is admitted to the hospital with a lower extremity cellulitis. His COPD is clinically stable.

WHAT ABNORMALITIES MIGHT YOU EXPECT TO SEE ??

---

---

---

---

---

---

---

---

## COPD -- Predictions

- ◆ We have no reason to expect the cellulitis to effect the pateint's pulmonary problem.
- ◆ COPD patients MAY have a chronic respiratory acidosis.
- ◆ A chronic respiratory acidosis will induce some metabolic compensation

---

---

---

---

---

---

---

---

## COPD -- Lab Values

139	98	19	}
4.9	31	1.0	

ABG on RA: 7.34 / 60 / 60

---

---

---

---

---

---

---

---

## Case 4) COPD -- Interpretation

139	98	19
4.9	31	1.0

ABG on RA: 7.34 / 60 / 60

The patient has a moderate acidemia.  
The bicarbonate is HIGH, and the anion gap is normal.  
The pCO<sub>2</sub> is VERY HIGH, consistent with our prediction about a patient with COPD. THE PRIMARY DISTURBANCE IS PROBABLY RESPIRATORY

The expected rise in HCO<sub>3</sub><sup>-</sup> is:  $.35 \times (60-40) = .35 \times 20 = 7 \text{ meq/L}$

---

---

---

---

---

---

---

---

## Case 5 -- Lab Values

139	102	19	}
4.9	25	1.0	

ABG on RA 7.24 / 39 / 86

WHAT IS THE PROBLEM IN THIS CASE  
??

---

---

---

---

---

---

---

---

## Case 5 -- Interpretation

139	102	19	ABG on RA 7.24 / 39 / 86
4.9	25	1.0	

The patient has a moderate acidemia.  
The bicarbonate is normal, as is the anion gap.  
The pCO<sub>2</sub> is normal as well.

REMEMBER THE EQUATION:

$$[H^+] = 24 \times pCO_2 / [HCO_3^-]$$

---

---

---

---

---

---

---

---

## Case 5 -- Interpretation

Plugging in the values from the case, we get:

[H<sup>+</sup>]     ≈ 56 neq / L ..... our estimate  
HCO<sub>3</sub><sup>-</sup>   = 25 meq / L  
pCO<sub>2</sub>    = 39 mm Hg

$$56 = 24 \times (39 / 25)$$

The numbers do not fit. Some piece of data is  
incorrect !!!!!!!

---

---

---

---

---

---

---

---

### Case 5 -- Interpretation

139	102	19	ABG on RA 7.24 / 39 / 86
4.9	25	1.0	ABG on RA <u>7.42</u> / 39 / 86

Perhaps someone in the lab wrote down the pH incorrectly.

If the pH were 7.42 instead of 7.24, the  $[H^+]$  would be 38, and the equation would be an identity.

ONE CAN USE THE FORMULA RELATING  $[H^+]$ ,  $[HCO_3^-]$ , AND  $pCO_2$  TO CHECK FOR CONSISTENCY

---

---

---

---

---

---

---

---

### Case 6 -- Lab Values

139	110	19	}
3.0	18	1.0	

ABG on RA: 7.36 / 33 / 95

WHAT IS THE ACID-BASE DISTURBANCE ??  
WHAT MIGHT BE CAUSING IT ??

---

---

---

---

---

---

---

### Case 6 -- Interpretation

139	110	19	ABG on RA: 7.36 / 33 / 95
3.0	18	1.0	

The pH is slightly low -- slightly acidemic  
The  $HCO_3^-$  is slightly low, c/w a metabolic acidosis  
The anion gap is normal. One cause of a normal anion gap metabolic acidosis is a RENAL TUBULAR ACIDOSIS.  
The hypokalemia is something commonly seen with RTA's  
The respiratory compensation is appropriate.

---

---

---

---

---

---

---

---

## Case 7 -- Lab Values

139	110	19	}
4.0	20	1.0	

ABG on 40% O<sub>2</sub>: 7.44 / 30 / 55

WHAT IS THE ACID-BASE DISTURBANCE ??

WHAT MIGHT BE CAUSING IT ??

---

---

---

---

---

---

---

---

## Case 7 -- Interpretation

139	110	19	ABG on 40% O <sub>2</sub> : 7.44 / 30 / 55
4.0	20	1.0	

The pH is slightly alkalemic.

The bicarbonate is low, c/w a metabolic acidosis.

The pCO<sub>2</sub> is also low, c/w a respiratory alkalosis.

pH CHANGES USUALLY REFLECT THE PRIMARY PROBLEM, therefore:

The changes are most c/w a primary resp. alkalosis with a metabolic compensation.

---

---

---

---

---

---

---

---

## Case 7 -- Interpretation

139	110	19	ABG on 40% O <sub>2</sub> : 7.44 / 30 / 55
4.0	20	1.0	

The expected compensation for a primary respiratory alkalosis is given by the formula:

◆ Respiratory Alkalosis

-ACUTE: [HCO<sub>3</sub><sup>-</sup>] decreases by .2 x the fall in pCO<sub>2</sub>

-CHRONIC : [HCO<sub>3</sub><sup>-</sup>] decreases by .5 x the fall in pCO<sub>2</sub>

The expected decrease in HCO<sub>3</sub><sup>-</sup> is 5 meq/L

---

---

---

---

---

---

---

---

## Case 8 -- History and Physical

- ◆ A 54 y/o man with COPD is admitted with a two-day history of progressive shortness of breath and increasing sputum production.
- ◆ He is diffusely wheezing on examination, and his air movement is poor.
- ◆ His CXR shows a LLL pneumonia

---

---

---

---

---

---

---

---

## Case 8 -- Labs

139	100	19	}
4.0	30	1.0	

ABG on RA: 7.25 / 70 / 50

---

---

---

---

---

---

---

---

## Case 8 -- Interpretation

139	100	19
4.0	30	1.0

ABG on RA: 7.25 / 70 / 50

The clinical scenario is c/w some degree of respiratory acidosis, either acute or chronic. The pH is acidemic, the pCO<sub>2</sub> elevated, and the HCO<sub>3</sub><sup>-</sup> elevated, c/w a compensated respiratory acidosis, BUT... The degree of compensation is NOT what we would expect. The most likely explanation is a baseline chronic respiratory acidosis with a superimposed worsening resp. acidosis.

---

---

---

---

---

---

---

---

## Case 9 -- History

- ◆ A 63 y/o man with insulin-requiring diabetes mellitus but a history of poor compliance with his diet and treatment is brought to the emergency room after passing out.
- ◆ His finger-stick glucose in the field was 40

---

---

---

---

---

---

---

---

## Case 9 -- Labs

132	117	43	}
5.2	9	3.3	

ABG on RA: 7.23 / 28 / 107

---

---

---

---

---

---

---

---

## Case 9 -- Interpretation

132	117	43
5.2	9	3.3

ABG on RA: 7.23 / 28 / 107

He has a normal-anion-gap metabolic acidosis. The predicted respiratory compensation would result in a pCO<sub>2</sub> of 20.8 mm Hg, so there is a second process involved.

Clinically, this could be either a decrease in his respiratory drive due to his altered state of consciousness, or an acute-on-chronic metabolic acidosis, without enough time for further compensation.

---

---

---

---

---

---

---

---

## Case 10 - History and Physical

The patient is a middle aged man with arthritis of his knee. He was referred to Loyola. Medications include HCTZ and Furosemide, for ankle edema. In his clinic visit, he was noted to be tachycardic. He was otherwise asymptomatic.

In the ER, they were concerned about the possibility of PE.

---

---

---

---

---

---

---

Tachycardic OA pt. -- Answers

142	103	}
2.5	29	

ABG on Room Air

7.66 / 24 / 116

He has a "contraction alkalosis" with hypokalemia, from the diuretic.

He was told to "breathe deeply" before they drew his ABG, because it would hurt.
